(REGC) UNIV CALIFORNIA.

Saxon A, Zhang K, Zhu D; WPI; 2003-103456/09. New fusion molecules comprising polypeptide sequences that bind to IgG inhibitory receptor and native IgE receptor, useful for treating IgE-mediated hypersensitivity reactions, e.g. asthma or allergies, or autoimmune diseases.

Claim 19; Fig 3; 116pp; English.

The present invention relates to a fusion molecule comprising a first polypeptide sequence capable of specific binding to a native IgG inhibitory receptor consisting of an immune receptor tyrosine-based inhibitory motif (TIM), expressed on mast cells, basophils or B cells, functionally connected to a second polypeptide sequence capable of specific binding directly or indirectly to a native IgE receptor specific binding directly or indirectly to a native IgE receptor (FeepsilonR). Also provided are nucleotide sequences encoding such a fusion protein. The fusion molecules and compositions are useful for

inhibitory receptor consisting of an immune receptor tyrosine-based inhibitory motif (TIM), expressed on mast cells, basophils or B cells, functionally connected to a second polypeptide sequence capable of specific binding directly or indirectly to a native IgE receptor (Fcepsilons). Also provided are unclectide sequences encoding such a fusion protein. The fusion molecules and compositions are useful for treating an IgE-mediated biological response, preferably an IgE-mediated bringing and a sathma, allergic rhintis, a topic dermatitis, severe food allergies, chronic urticaria, angloedema or anaphylactic shock; or autoimmune diseases such as rheumatoid arthritis, type-I diabetes mellituus, or multiple sclerosis, and for preventing of, or symptoms resulting from, a type I hypersensitivity reaction in a subject receiving immunotherapy. The present sequence is the human IgGI

Claim 35; Fig 7; 116pp; English.

The present invention relates to a fusion molecule comprising a first polypeptide sequence capable of specific binding to a native IgG inhibitory receptor consisting of an immune receptor tyrosine-based inhibitory motif (ITIM), expressed on mast cells, basophils or B cells, functionally connected to a second polypeptide sequence capable of specific binding directly or indirectly to a native IgE receptor (FeepsilonR). Also provided are nucleotide sequences encoding such fusion protein. The fusion molecules and compositions are useful for treating an IgE-mediated biological response, preferably an IgE-mediated hypersensitivity reaction, such as asthma, allergic rhinitis, atopic dermatitis, severe food allergies, chronic urticaria, angiedema or anaphylactic shock; or autoimmune diseases such as rheumatoid arthritis, type-I diabetes mellitus, or multiple sclerosis, and for preventing of, or symptoms resulting from, a type I hypersensitivity reaction in a subject receiving immunotherapy. The present sequence is a gammahinge-CHgamma2-CHgamma3-(Gly4Ser)3-CHepsilon2-CHepsilon3-CHepsilon3 fusion protein (designated GE2) of the invention

A novel recombinant vector has been developed which comprises a nucleotide sequence encoding a fusion protein. The fusion protein comprises three domains joined together in order, from N-terminus to terminus, of a first domain comprising a protein of interest, a second domain comprising anydrophilic spacer and an affinity domain, each the hingey for region of human IgG1, used in example 3 of the present the hingey for region of human IgG1, used in example 3 of the present invention. The recombinant vector is used for the production of authentic recombinant proteins of interest. The method of the invention is useful for the expression of fusion proteins capable of isolation by affinity chromatography in pro- or eukaryotic cells. This method allows for the efficient cleavage and generation of authentic proteins of interest that do not contain extraneous (i.e. non-naturally occurring) amino acids
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    120

of lytic bone disease or multiple myeloma. Also the method can be used the preventing metastasis of cancer to bone or osteosclerotic bone metastasis. The method comprises administering an OPG (osteoprotegrin) polypeptide or OPG fusion protein. The OPG proteins (see AAB80899) can inhibit formation of osteoclasts (and thus bone resorption) by blocking differentiation from monocytes/macrophage precursors. The present sequence is the hinge, CH2 and CH3 regions of human IgGgammal. This sequence can be used to generate fusion proteins of OPG and immunoglobulin, for use in the present invention. The generated fusion proteins can exhibit increased circulating half-lives and slower
                                                                           Preventing or treating lytic bone diseases, particularly associated with cancer or metastasis, by administering an osteoprotegrin polypeptide.
                                                                                                                                                      The present invention relates to a method for the prevention or treatment

                                                                                                                                                              The present sequence was used in the production of AGP-1 fusion proteins. AGP-1 is a type II transmembrane protein. The fusion proteins comprise an PC immunoglobulin region fused to the N-terminal portion of the AGP-1 protein. The fusion proteins can be used to induce apoptosis in a tissue, and to treat proliferative disorders, immune disorders, or virally-induced disorders. The proliferative disorders include cancers, such as breast, prostate, lung or colon cancer. The viral infections include hepatitis, and acquired immunodeficiency syndrome (ALDS), and the immune disorders may be autoimmune disorders or transplant rejection. Cardiovascular diseases such as arteriosclerosis may also be treated. The AGP-1 containing fusion proteins have increased biological activity compared to the soluble AGP-1 proteins used in prior art therapies

The patent discloses fusion protein comprising human osteoprotegerin (OPG) protein fused by linker to human 1gd1 Fc portion. OPG negatively regulates formation of osteoclasts in vitro and in vivo. It blocks the differentiation of osteoclasts from monocyte or mercephage precursors and the treatment of bone. The OPG-Fc fusion protein is administered for the treatment of bone loss resulting from osteoponis, Paget's disease, osteomyalitis, Mypercalcaemia, osteopenia associated with surgery or steroid administration, osteomecrosis, bone loss due to rheumatoid arthritis, periodontal bone loss, osteolytic metastasis and/or prosthetic lossening. The present sequence is partial human immunoglobulin G (Ig G) 1 protein comprising the hinge and heavy chain constant regions CH2 and CH3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 120

The invention relates to a method for increasing and maintaining haematocrit in a mammal. The method comprises administering a hyperglycosylated analogue of erythropietin (Epo) in a pharmaceutical composition, less frequently than an equivalent molar amount of and at a lower molar amount than recombinant human Epo (rHuEpo) to obtain a comparable target hematocrit. Epo is a glycoprotein hormone necessary for the maturation of erythroid progenitor cells into erythrocytes. Human Epo analogue is useful for raising and maintaining haematocrit to a comparable target hematocrit in a mammal suffering from anaemia comparable target hematocrit in a mammal suffering from anaemia therapy comprising chemotherapeutic or anti-viral drugs or associated with a decline or loss of kidney function, myelosuppressive therapy comprising chemotherapeutic or anti-viral drugs or associated with excessive blood loss during surgical procedures, and in cancer condition. The present sequence is human immunoglobulin G (IgG) gamma 1 constant heavy chain (CH2, CH3) hinge region used to construct Epo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            120

Disorders treatable amyloid caused or characterised by deposits of TTR (eg. familial amyloid cardiomyopathy), PPP (eg. spongiform encephalopathy in cows and creuzfelde.Jacob disease (CJ) and Gerstmann.Straussler-Scheinker syndrome (GSS) in humans), IAPP (eg. insulinoma, adult onset diabetes), ANF (eg. isolated atrial amyloid, kappa or lambda light chain (eg. hereditary non-reuropathic systemic amyloidosis), Apo A-I (eg. hereditary non-reuropathic systemic amyloidosis), Apo A-I familial amyloidosis of Finnish type), Fibrinogen (eg. hereditary renal amyloidosis of Ennish type), Fibrinogen (eg. hereditary renal amyloidosis of Ennish type), Fibrinogen (eg. hereditary renal amyloidosis of myloidosis. The present sequence is human IgG1 heavy chain, used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             120
                                                                                                                                                                                                                                                                                                                                                  The invention relates to a compound comprising an immunoglobulin (Ig) heavy chain constant region or its fragment that retains the ability to bind an PC receptor linked by a linker group or a direct bond to a peptide capable of binding an amyloidogenic protein. The invention is useful for clearing an amyloidogenic protein. The invention is transthyretin (TTR), prion protein (PrP), islet amyloid polygeptide (IAPP), atrial natriuretic factor (ANP), kappa light chain, lambda light chain, amyloid A, procalcitonin, cystatin C, beat2-microglobulin, ApoA-I, gelsolin, calcitonin, fibrinogen, Huntington, alpha-symuclein and lysozyme from a subject and for treating an amyloidogenic disorder such
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          120

The invention relates to a compound (I) binding to tissue factor (TF). The compound (I) has the formula A-(LM)-C, where A is a FVIIa polypeptide, LM is an optional linker group, C comprises an polypeptide, LM is an optional linker group, C comprises an modification of factor domain, and (I) binds to TF. (I) inhibits TF-mediated activated factor VII (FVIIa) activity. (I) is useful as a medicament, and for the manufacture of a medicament for preventing or treating disease or disorder associated with pathophysiological TF activity. The disease or disorder associated with pathophysiological TF activity are deep venous thrombosis, arterial thrombosis, post surgical thrombosis, coronary artery bypass graft (CABG), percutaneous transdermal coronary angioplastry (PTCA), stroke, cancer, tumor metastasis, angioplastry (PTCA), stroke, cancer, tumor metastasis, angioplastry (PTCA), stroke, cancer, tumor metastasis, and restenosis following angioplastry, acute and chronic indications such as inflammation, septic shock, septicemia, hypotension, adult respiratory distress syndrome (ARDS), disseminated intravascular coagulopathy (DIC), pulmonary embolism, platelet deposition, myocardial infarction, or prophylactic treatment of mammals with atherosclerotic vessels at risk for thrombosis. The present sequence represents the Fc domain fragment of human immunoglobulin GI (19G1).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New compound binding to tissue factor, useful for treating diseases such as anglogenesis, ischemia/reperfusion, and rheumatoid arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Steenstrup
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Claim 16; SEQ ID NO 7; 61pp; English.

Human IgG Fc fragment amino acid sequence. ABB09463 standard; protein; 233 AA 01-JUL-2002 ABB09463;

```
The invention relates to a transformant yeast that can present protein A or its fragment on its cell surface. The yeast can be used for detecting or isolating the Fc part of immunoglobulin (Ig)G. The yeast is useful for a stable supply of highly active catalytic antibody e.g. by screening novel functional molecules and in isolating Fc-carrying secretory to a combinatorial antibody library with an Fc-carrying antibody to a combinatorial antibody library with an Fc-carrying antibody component. The current sequence represents the human IgG Fc fragment
                                                                                                                                                                                                                                                                                                                                                                                                                        Transformant yeast for stable supply of highly active catalytic antibody, comprises the capability of expressing and presenting protein A or its fragment, particularly with the ZZ domain, on the cell surface.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     61 NWYVDGVEVHNVKTKPREEQYNSTYRVVSVLTVLHQNWMNGKEYKCKVSNKALPAPIEKT

portion of an isolated antibody, which has an increased affinity for a receptor protein tyrosine kinase and which blocks constitutive activation of the receptor protein tyrosine kinase. The methods and compositions of the invention are useful for treating or inhibiting a skeletal dysplasia or aniosynoatosis or a cell proliferative disorder. The skeletal dysplasia is achondroplasia, thanatophoric dysplasia, hypochondroplasia, severe achondroplasia with developmental delay or acanthosis ingricans dysplasia in the craniosynostosis of crouge disorder is Muenke coronal craniosynostosis or Crouzin syndreme with acanthosis ingricans. The cell proliferative disorder is tumour progression that is progression of transitional cell carcinoma, osteosarcoma, chondrosarcoma, multiple myeloma or mammary carcinoma. This sequence represents a protein derived from a pCXFC plasmid DNA vector relating to the protein tyrosine kinase inhibitor of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     120

                                                                                                                                                                                                                Homo sapiens.
                                                                                                                                                                                                                                                             27-DEC-2002.
                                                                                                                                                                                                     Synthetic.
```

The present invention describes a molecule (I) comprising the antigen binding portion of an isolated antibody which has specific binding affibroblast growth factor receptor (FGFR), and which blocks constitutive a tibroblast growth factor receptor (FGFR), and which blocks constitutive comprising (I) as an active ingredient and a pharmaceutical carrier, comprising (I) as an active ingredient and a pharmaceutical carrier, comprising (I) as an active ingredient and a pharmaceutical carrier, comprising (I) at least one reagent for detecting the presence of (I) when bound to the RPTK, and instructions for use; (3) a method for treatment of bone and cartilage related disorders by administering a composition of (I) to the subject; (4) a method for treating or inhibiting a cell proliferative disease or disorder by administering the composition of (I); (S) a method for screening a molecule comprising the antigen-binding portion of an antibody which blocks ligand-dependent activation of RPTK; (6) an antibody which blocks ligand-dependent activation of RPTK; (6) an antibody which blocks ligand-dependent activation of RPTK; (6) and WH region; (8) vectors comprising a mucleic acid molecule of (6) or (7); and (9) host cells transformed with the vector: (I) have osteopathic, cycostatic and ophthalmological activities, and can be used as RPTK inhibitor. Compositions comprising (I) are useful for treating bone and cartilage disorders, including skeletal disorders such as skeletal dysplasia, severe achondroplasia, thanatophoric dysplasia, decondroplasia, decondroplasia, decondroplasia, decondroplasia, decondroplasia, decondroplasia, decondroplasia, decondroplasia, dec acanthosis nigricans dysplasia) or a craniosynostosis disorder (e.g. Muenke coronal craniosynostosis or Crouzon syndrome with acanthosis nigricans). The composition may also be used for treating or inhibiting

The invention relates to a binding domain. Immunoglobulin heavy chain comprising a binding domain polypeptide that is fused to an immunoglobulin heavy chain CH2 constant region polypeptide that is fused to the CH2 constant region polypeptide. The immunoglobulin heavy chain CH3 constant region polypeptide that is fused to the CH2 constant region polypeptide. The immunoglobulin hinge region polypeptide comprises: a wild-type human IgG1 immunoglobulin hinge region polypeptide comprises: a wild-type human IgG1 immunoglobulin hinge region polypeptide comprises: a wild-type human IgG1 immunoglobulin hinge region polypeptide comprises: where the mutated human IgG1 immunoglobulin hinge region polypeptide of polypeptide control of contains or cysteine residues, where the mutated human IgG1 immunoglobulin hinge region polypeptide, derived from (a) having 3 or more cysteine residues, where the mutated human IgG1 immunoglobulin hinge region polypeptide, derived from (b) having 3 or more cysteine residues and a mutated human IgG1 immunoglobulin hinge region polypeptide contains or orysteine residues. The binding domain immunoglobulin hinge region polypeptide contains or orysteine residues. The binding domain immunoglobulin hinge region polypeptide contains or orysteine residues. The binding domain immunoglobulin hinge region polypeptide contains or orysteine residues. The binding domain immunoglobulin fusion protein, a host cell mediated cytotoxicity (ADCC) and complement fixation. The binding domain-immunoglobulin fusion protein, a recombinant expression construct comprising the binding domain-immunoglobulin fusion organizate, and treating a subject or subject dof having a malignant condition or a B-cell disorder. The binding domain-immunoglobulin fusion protein is useful for this patent formed mark of the printed sequence data for this patent formed mark of the printed sequence data for this patent formed mark of protein a malignant condit
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         120
